SUPSI

Operating Systems – Exercises #2

1. Experiment with the provided code

In class we discussed several examples of code related to process creation (fork and exec). To familarize yourself with those functions try out the code on your machine.

2. Let's go with the lab

From the course website you can download the workbook that will guide you through the implementation of a thread library. Your task for today's week is quite simple: read the workbook up until **section 3.1.3** (included). It is not necessary to compile the provided examples, however you should understand the underlying problem related to context-switch and how function calls work.
